Midfield Terminal Abu Dhabi Airport

Midfield Terminal Abu Dhabi Airport

Client: Eversendai Engineering LLC

Completed: November 2014

Product and Service:

Design and manufacture of 522no mechanical bearings.

Bearing inspection works post installation

EKSPAN Limited were instructed by Eversendai Engineering LLC following a consultation period with ARUP to provide the design and supply of 522 no mechanical bearings to suit the 58 no new link bridges to the new Midfield Terminal as part of Abu Dhabi Airport. Due to the complex requirements for loading bespoke permanent uplift bearings were designed and manufactured to provide permanent fixity whilst large lateral load bearings were designed to accommodate the significant lateral forces which were applied to the structure. As part of the contract EKSPAN were required to conduct a final sign off on the installation of all bearings so attended the Airport and worked alongside ARUP to conduct final checks prior to the opening of the 58 no structures.

Crum Creek Viaduct Pennsylvania

Crum Creek Viaduct, PA, SEPTA – Supply and supervision of two EKSPAN T-Mat 260 Expansion Joints

Crum Creek Viaduct – Pennsylvania

Client: Walsh Group

Completed: November 2016

Product and Service:

Design manufacture and installation of 2 x T-Mat

T260 Expansion joints

EKSPAN Limited were instructed by approached by FIGG engineering to assist in the design development of the bridge deck expansion joints for the Crum Creek Railway located in Swathmore, Delaware County.

Due to the T-Mat joints unique ability to be able to provide significant movements not just longitudinally and transversely but also vertically combined with its minimal maintenance requirements and ballast protection it was chosen. Shipping product to the United States was complex and a Buy America Approval was sought by Walsh group and supported by EKSPAN who provided evidence of the unique nature of this expansion joint.

Following an initial site visit to take all dimensional information all of the steelwork and the T-Mat could be fabricated. Once fabricated and shipped the expansion joint frames were set and the Mat Joint installed. EKSPAN installation crews worked alongside the Walsh Group operatives to ensure the expansion joint was installed fully in accordance with our installation instructions. The whole viaduct rehabilitation took around 3 months which included the building of the new decks as well as removal of the existing.

Domokos Bridge Greece

Domokos Bridge Greece

Client: Aktor SA Construction Company

Completed: 2018

Product and Service:

Design, manufacture and delivery of open type rail joint system

EKSPAN Limited were approached by Aktor to assist them in the design development of an open type rail bridge design for the Domokos Bridge in Greece. At the time of construction this was the largest cable stay rail bridge in the Balkans. The bridge itself crosses the active fault of Ekkara so it was critical that the expansion joint not just accommodate the day to day translations of the structure but also withstand earthquake conditions when required. . The joint movement exceeded +/-260mm and was specifically designed to retain ballast whilst providing a suitable seal capable of draining excess water away from the structure.
